

## Circular Motion 2

Q1.

One end of a light elastic string with modulus of elasticity 15 N is attached to a fixed point  $A$  which is 2 m vertically above a fixed small smooth ring  $R$ . The string has natural length 2 m and it passes through  $R$ . The other end of the string is attached to a particle  $P$  of mass  $m$  kg which moves with constant angular speed  $\omega \text{ rad s}^{-1}$  in a horizontal circle which has its centre 0.4 m vertically below the ring.  $PR$  makes an acute angle  $\theta$  with the vertical (see diagram).

(i) Show that the tension in the string is  $\frac{3}{\cos \theta}$  N and hence find the value of  $m$ . [4]

(ii) Show that the value of  $\omega$  does not depend on  $\theta$ . [4]

It is given that for one value of  $\theta$  the elastic potential energy stored in the string is twice the kinetic energy of  $P$ .

(iii) Find this value of  $\theta$ . [4]

---

Q2.

A horizontal disc with a rough surface rotates about a fixed vertical axis which passes through the centre of the disc. A particle  $P$  of mass 0.2 kg is in contact with the surface and rotates with the disc, without slipping, at a distance 0.5 m from the axis. The greatest speed of  $P$  for which this motion is possible is  $1.5 \text{ m s}^{-1}$ .

(i) Calculate the coefficient of friction between the disc and  $P$ . [2]

$P$  is now attached to one end of a light elastic string, which is connected at its other end to a point on the vertical axis above the disc. The tension in the string is equal to half the weight of  $P$ . The disc rotates with constant angular speed  $\omega \text{ rad s}^{-1}$  and  $P$  rotates with the disc without slipping.  $P$  moves in a circle of radius 0.5 m, and the taut string makes an angle of  $30^\circ$  with the horizontal.

(ii) Find the greatest and least values of  $\omega$  for which this motion is possible. [5]

(iii) Calculate the value of  $\omega$  for which the disc exerts no frictional force on  $P$ . [2]

---

## Circular Motion 2

Q3.

One end of a light inextensible string is attached to a fixed point  $A$  and the other end of the string is attached to a particle  $P$ . The particle  $P$  moves with constant angular speed  $5 \text{ rad s}^{-1}$  in a horizontal circle which has its centre  $O$  vertically below  $A$ . The string makes an angle  $\theta$  with the vertical (see diagram). The tension in the string is three times the weight of  $P$ .

- (i) Show that the length of the string is 1.2 m. [3]
- (ii) Find the speed of  $P$ . [4]
- 

Q4.

One end of a light inextensible string of length 0.5 m is attached to a fixed point  $A$ . The other end of the string is attached to a particle  $P$  of weight 6 N. Another light inextensible string of length 0.5 m connects  $P$  to a fixed point  $B$  which is 0.8 m vertically below  $A$ . The particle  $P$  moves with constant speed in a horizontal circle with centre at the mid-point of  $AB$ . Both strings are taut.

- (i) Calculate the speed of  $P$  when the tension in the string  $BP$  is 2 N. [5]
- (ii) Show that the angular speed of  $P$  must exceed  $5 \text{ rad s}^{-1}$ . [3]
- 

Q5.

A light inextensible string passes through a small smooth bead  $B$  of mass 0.4 kg. One end of the string is attached to a fixed point  $A$  0.4 m above a fixed point  $O$  on a smooth horizontal surface. The other end of the string is attached to a fixed point  $C$  which is vertically below  $A$  and 0.3 m above the surface. The bead moves with constant speed on the surface in a circle with centre  $O$  and radius 0.3 m (see diagram).

## Circular Motion 2

- (i) Given that the tension in the string is 2 N, calculate
- (a) the angular speed of the bead, [3]
  - (b) the magnitude of the contact force exerted on the bead by the surface. [2]
- (ii) Given instead that the bead is about to lose contact with the surface, calculate the speed of the bead. [4]
- 

Q6.

A small ball  $B$  of mass 0.5 kg moves in a horizontal circle with centre  $O$  and radius 0.4 m on the smooth inner surface of a hollow cone fixed with its vertex down. The axis of the cone is vertical and the semi-vertical angle is  $60^\circ$  (see diagram).

- (i) Show that the magnitude of the force exerted by the cone on  $B$  is 5.77 N, correct to 3 significant figures, and calculate the angular speed of  $B$ . [4]

One end of a light elastic string of natural length 0.45 m and modulus of elasticity 36 N is attached to  $B$ . The other end of the string is attached to the point on the axis 0.3 m above  $O$ . The ball  $B$  again moves on the surface of the cone in the same horizontal circle as before.

- (ii) Calculate the speed of  $B$ . [6]
- 

Q7.

A particle  $P$  of mass 0.15 kg is attached to one end of a light elastic string of natural length 0.4 m and modulus of elasticity 12 N. The other end of the string is attached to a fixed point  $A$ . The particle  $P$  moves in a horizontal circle which has its centre vertically below  $A$ , with the string inclined at  $\theta^\circ$  to the vertical and  $AP = 0.5$  m.

- (i) Find the angular speed of  $P$  and the value of  $\theta$ . [5]
- (ii) Calculate the difference between the elastic potential energy stored in the string and the kinetic energy of  $P$ . [4]
-

## Circular Motion 2

Q8.

A particle  $P$  of mass  $0.2 \text{ kg}$  moves with speed  $4 \text{ m s}^{-1}$  and angular speed  $5 \text{ rad s}^{-1}$  in a horizontal circle on a smooth surface.  $P$  is attached to one end of a light elastic string of natural length  $0.6 \text{ m}$ . The other end of the string is attached to the point on the surface which is the centre of the circular motion of  $P$ .

(i) Find the radius of this circle. [1]

(ii) Find the modulus of elasticity of the string. [4]

---

Q9.

A hollow cylinder with a rough inner surface has radius  $0.5 \text{ m}$ . A particle  $P$  of mass  $0.4 \text{ kg}$  is in contact with the inner surface of the cylinder. The particle and cylinder rotate together with angular speed  $6 \text{ rad s}^{-1}$  about the vertical axis of the cylinder, so that the particle moves in a horizontal circle (see diagram). Given that  $P$  is about to slip downwards, find the coefficient of friction between  $P$  and the surface of the cylinder. [4]
